

Booting Process of a Computer System

The power supply sends electricity to the components of the computer, such as the motherboard, hard drive, and fans

BIOS Interaction

(BIOS)

Is the program a computer's microprocessor
Uses to start the computer system after its powered on

(OS) An operating system is the most important
software that runs on a computer.

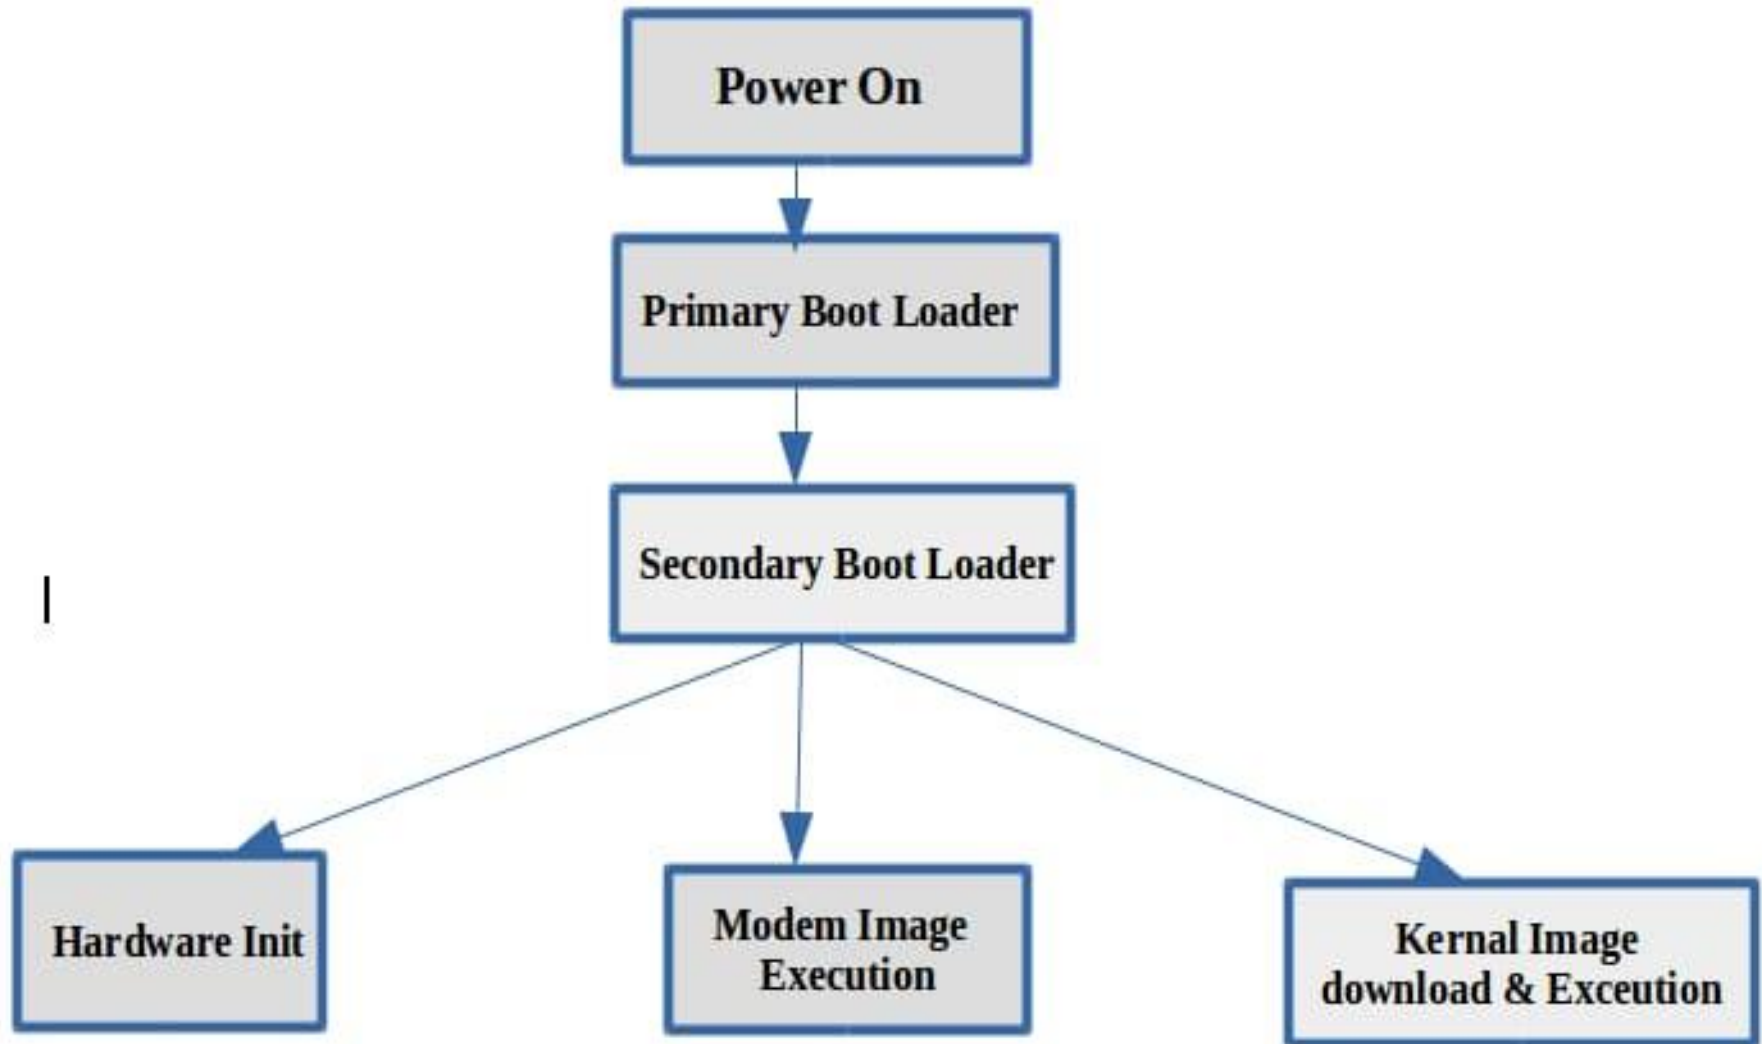

(Driver) A set of files that tells a piece of hardware how
to function by communicating with a computer's
operating system

(Motherboard) A set of files that tells a piece of
hardware how to function by communicating with a
computer's operating system

Tasks performed at boot up

- ▶ Run diagnostics to determine the state of machine. If diagnostics pass, booting continues.
- ▶ Runs a Power-On Self Test (POST) to check the devices that the computer will rely on, are functioning.

Boot Rom & Boot Loader

Secondary Boot Loaders

- ▶ If there is no active partition or the active partition's boot sector is invalid, The Master Boot Record (MBR) may load a secondary boot loader and pass control to it and this secondary boot loader will select a partition (often via user input) and load its boot sector.
- ▶ Examples of secondary boot loaders
 - GRand Unified Bootloader
 - Linux LOader
 - NT Loader

(UEFI)

- Is a modern computer software that starts up devices, ensuring compatibility, security and advanced features

Thank You
