Assignment - 1

Q1. What are the anthropogenic activities and its impact on environment?

Ans- Any human practices that have the potential to impact the environment locally as well as globally are considered as Anthropogenic activities. The present era on earth is known as the Anthropocene age because now humans are directing the environmental changes on earth.

- fossil fuels, mineral, timber, agriculture, Recreational, etc. are the natural resources used by society, and the pieces of these natural resources converted atmosphere which creates the pollution which is named Anthropogenic.

★ Impact on Anthropogenic Activities on environment:

- The versatile affiliation on human civilization with nature, whose properties will in a change in space and in time opens man to fluctuated ecological impacts.
- According to fox news volcanic emission released during ancient mass extinction offers us a warning, scientists said "our estimates suggest that the ~~ent~~ amount of CO₂ that each camp magmatic injected into the end-triassic atmosphere is comparable to the no of anthropogenic emissions projected for the 21st Century?"

Date ____ / ____ / ____

Q2- Write a short note on the types of food chain?

Ans- A food chain is the sequence of events in an ecosystem in which one living organism eats another organism, which is then eaten by a larger organism. A food chain is the movement of nutrients and energy from one creature to another at different trophic levels.

The feeding pattern or relationship between living species is also explained by food chain. Trophic level refers to the order in which producers, primary, secondary and tertiary consumers appear in a food chain, starting at the bottom with producers and ending with primary, secondary, and tertiary consumers. A trophic level is lowest level in a food chain. Detritus food chain and grazing food chains are two forms of food chains.

Detritus food chain is type of food chain the starts with dead organic substance are decomposed by microorganisms.

The grazing food chain is a type of food chain in which energy at the lowest trophic level is acquired via photosynthesis the grazing food chain begins with producers like green plants.
